Motor learning is also accomplished on the musculoskeletal level. Each motor neuron in the body innervates one or more muscle cells, and together these cells form what is known as a motor unit. For a person to perform even the simplest motor task, the activity of thousands of these motor units must be coordinated.

Apraxia. Our current clinical approach to apraxia is similar to that proposed by Liepman in the early 20th century.¹ He recognised that left hemispheric lesions tend to cause bilateral upper limb apraxia and suggested a model of motor control in which the left parietal lobe stores a 'space-time form picture' of a movement. For a movement to be executed, its picture must be retrieved and ...
