NS allows the simulation of x ed and/or mobile wireless LANs, multihop ad-hoc networks, combined wired and wireless networks. NS implements IEEE 802:11 mac protocol and different mobile routing protocols. Currently, NS implements four ad-hoc routing protocols which are Destination Sequence Distance Vector (DSDV), Dynamic Source

NS-2 is an open-source discrete event network simulator which is widely used by both the research community as well as by the people involved in the standardization protocols of IETF. The goal of this book is twofold: on one hand to learn how to use the NS-2 simulator, and on the other hand, to become acquainted with and to understand the operation of some of the simulated objects using NS-2 simulations.

An introduction to network simulation Network simulation is the process by which a computer network is modelled by identifying, analysing and quantifying the interaction between various network devices and software. Mathematical modelling is used to study the behaviour of a computer network rather than using actual data.

This book starts off with an introduction to network simulation in Chap.1.We briefly discuss about computer networks and the layering concept. Then we give board statements on system analysis approaches. As one of the two main approaches, simulation can be carried out in time-driven and event-driven modes. The latter is the one NS2 was developed.

OPNET Network simulator is a tool to simulate the behavior and performance of any type of network. The main difference Opnet Network Simulator comparing to other simulators lies in its power and versatility. IT Guru provides pre-built models of protocols and devices. It allows you to create and simulation different network topologies.

Network Simulator (Version 2), widely known as NS2, is simply an event-driven simulation tool that has proved useful in studying the dynamic nature of communication networks. Simulation of wired as well as wireless network functions and protocols (e.g., routing algorithms, TCP, UDP) can be done using NS2.

We first introduce the architecture and a high security scheme that can be deduced from a strong closed authentication where the customers can get a perfect privacy. Then, we describe network virtualization that can provide a powerful way to run multiple networks, each customized to a specific purpose, at the same time over a shared substrate.
