The book (volume I) starts with analysis on the real line, going through sequences, series, and then into continuity, the derivative, and the Riemann integral using the Darboux approach. There are plenty of available detours along the way, or we can power through towards the metric spaces in chapter 7.

INTRODUCTION TO REAL ANALYSIS - Trinity University

This statement is the general idea of what we do in analysis. Suppose next we really wish to prove the equality $x = 0$. In analysis, we prove two inequalities: $x \geq 0$ and $x \leq 0$. To prove the inequality $x \geq 0$, we prove $x \geq \epsilon$ for all positive ϵ . To prove the inequality $x \leq 0$, we prove $x \leq -\epsilon$ for all positive ϵ . The term real analysis is a little bit of a misnomer.

Solution: Let $\epsilon > 0$ be given, and consider for each $x \in K$ the set $B(x)$. This is clearly open since it is an open ball. Also note that $\{B(x) : x \in K\}$ is an open cover of K . Since K is compact, we have that this open cover has a finite subcover, and so there exists a finite set $T \subset K$ such that $K \subset \bigcup_{x \in T} B(x)$: Thus, we have that K is totally bounded.
